

## OM-PIMESPO XOP2 vertical order pickers are compact, powerful vehicles and are capable of picking up to $\mathbf{6 0 0 0} \mathbf{m m}$.

## Available in two versions:

- with fixed forks, without additional lift additional: two robustly welded forks on the operator platform allow direct access onto the order picking pallet order picking.
- with lifting forks with additional lift: thanks to the additional lift during picking it is possible to carry the pallet at operator height.

## Specifications

- Overall chassis width: 880-980-880

980-1080 mm

- Operator platform: width 900-1000 1100-1200-1300-1400 mm
- Operator platform height: up to 4365 mm

## Driver's cabin

The ergonomics of the driver's cabin guarantee excellent performance. The suspension of the driver's cabin and the floor of the cabin absorb bumps and rocking which may occur while being driven, or during liftting or lowering. An ample padded backrest offers a relaxing driving position. The low position of the rise and the protection bars on three sides increase the level of safety. A control panel with generously dimensioned controls means fast and safe operation. The control panel can either be used on the column side or on the side of the load. This gives the operator excellent visibility over the picking area or over the driving direction. The control panel has an integrated display which informs the driver of all the funcions of the truck. By means of keys it is possible to see and select hours worked, heights, wheel position, battery level, as well as other information for the operators and other workers. Another instrument control panel allows the activation of special functions and the lighting fixed onto the driver's protection roof. The neon lighting tubes for illumination can be activated individually, with the beam of light directed towards shelving, forks or for illuminating the cabin.
Integrated object cupboards are housed in the internal trimmings, with stationary holder shelf, space for bottles, cans or tools. A transparent plastic sheet fixed to the column between the column masts, protects the operator from draughts and engine noise. A cable lowering device is integrated into the operator's protection roof. Furthermore, the open structure of the protective roof gives free upward visibility.

## Chassis

The chassis is an extremely rigid steel structure. The engine is protected by a sheet-steel cover which is lifted by gas struts.
The battery cover is metal.

## Drive

The drive motor mounted vertically forms a single drive unit with the transmission, the magnetic brake and the drive wheel. The order picker can be fitted with guide rolls, which are useful in narrow aisles.

## Battery

DIN 48V - 420 Ah or 560 Ah battery. Ability to change the battery from both sides, by means of a fork lift truck or roller. The flat battery indicator is connected with a lift stop device.

## MasterDrive control

- The easy to see controls offer excellent reliability and a high standard of safety, guaranteeing good function performance
- Fast, safe picking operations thanks to the combined horizontal travel movement and of the cabin lift (diagonal motion along the aisle)
- Energy recovery for extending operating time
- Height registering system
- Differentiated forward and reverse speeds which can be regulated for each gear
- Simultaneous movements such as gears and lift, are possible even outside the
- The deadman pedal and the two-hand control protect all movements of gears and lifting
- An integrated diagnostics and service interface makes configuration and setting parameters easy with the service laptop
- Permanent error code memory
- Visualization of error codes

## Steering

The standard fit electric steering always takes the wheel to a central position on ignition. The order picker is easily and precisely manoeuvrable.

## Steering override

Mechanical and inductive steering without contact.
In mechanical steering mode straight-line steering of the order picker drive wheel is assured automatically.

## Masts

The compact construction of the column guarantees stability and torsional rigidity even at elevated heights, guaranteeing increased safety.

The excellent visibility through the column and at the sides offers good visibility.

## Hydraulic system

All hydraulic movements are optimized by start/stop ramps and by the proportional valve damping technology during the movement of loads.

## Brakes

The regenerative braking system is automatically activated when the butterfly switch is released. The activation of the start switch in the opposite direction in the same way produces sensitive and smooth braking.
Cross-current braking on one side reinforces the braking action and on the other recovers energy. The system of split braking operates almost without wear: the mechanical brake stops the order picker in rest mode and in the case of an emergency stop.

## Additional equipment

- Automatic braking at the end of the aisle
- Lifting limits
- Mechanical and inductive drive
- Controls on column and/or on loading side
- Lighting adjustable towards shelving, on the pallet or inside the cabin
- Ventilator in the protective overhead guard operator
- Data terminal for the transfer of information to printer and scanner
- Additional lifting of the forks
- Chassis in various widths
- Operator's protective overhead guard in different heights
- Writing area with document holder
- Feed attachment on operator's protective overhead guard for external users
- Operator's protective overhead guard in Makrolon
- Roller for side battery changing
- Set of cables for interchangeable battery
- Padding for side barrier
- Equipped for refrigerator units
- Covering for load side with storage and inter-changeable rear padding
- Special equipment available on request

The technical specifications quoted are given as an indication. OMPIMESPO reserves the right to modify them without warning
